Autoregressive Models are powerful ...

... but have **no** explicit global image representation

Conditional
Generation

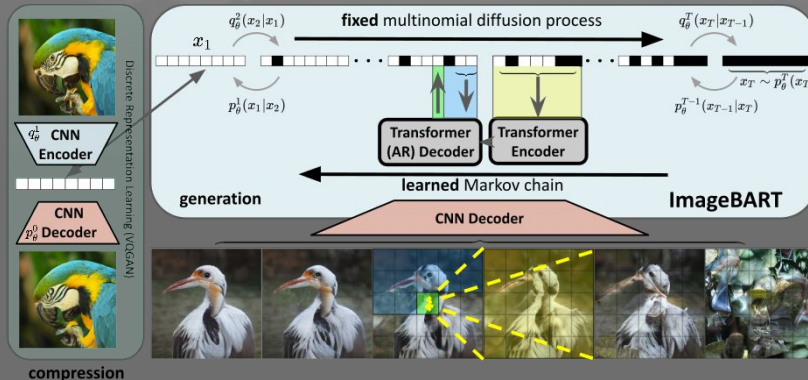

Exposure
Bias

→ unrealistic modifications

Global Context by Reverting a Multinomial Diffusion Process (MDP)

- Sequence of independent AR models reverts fixed MDP
- Global context based on preceding representation
- Efficiently learned in latent space of VQGAN

- ✓ High-fidelity and high-resolution image synthesis
- ✓ Flexible conditional AR models

High-Fidelity Image Synthesis

Upper Half Completion with Global Context

Image Editing without retraining ...

... unconditional

... conditioned on text prompts ...

... or class labels.
